

Project 1

When I started Project 1 I thought I knew exactly what to do. I only knew part of how to solve this problem. I was correct with adding an event listener. I was incorrect on what kind.

To begin work on Project 1 I followed the instructions in the assignment. I set up my folders and code as per recommendations. I used w3schools to research event listeners for “key up”.

The coding went relatively easy, but the testing was more involved. I had to restart XAMPP and learn the correct way to clear the cache.

After a few minor difficulties I completed Project 1.

Project 2

Project 2 was by far more complicated than Project 1. There were many things I did not know where to start, but I was aware of many of my deficits.

I completed three POCs to get my project where it is. The POCs were on drag and drop, the timer and loading the JSON file. In order to complete the project I feel I would have done additional POCs on the matching the terms to the definitions, using dynamic html and the undo functionality.

When I initially started Project 2 I did not use the scaffolding provided. Sometime after I completed the drag and drop POC my project stopped dragging and dropping correctly. I was unable to find the problem after extensive testing. I decided to stop wasting time and started over using the provided code.

I used a tutorial on w3schools to complete the drag and drop POC. I used a youtube video from TechnicalCafe to complete the timer POC. I also used a youtube video from LearnWebCode to do the loaddata POC.

Although I have not yet completed Project 2 I felt that I learned a lot about during this process.
